Using the DxDiag utility in Windows XP, Vista and 7 (x86 & x64)

The DxDiag tool is a DirectX diagnostic tool. It gathers system information, such as version of Windows, Graphics card specification and Graphics card driver. Running this utility and sending the results to your reseller can help them in troubleshooting some possible hardware configuration issues.

PC users, IT departments

In Windows XP, click on Start – Run, then type in dxdiag

In Windows Vista or Windows 7, Click on Start, then type in dxdiag

If a message pops up, click OK or Next so that the system can generate your System report

Click on the Save all Information button, and save a .txt file to your desktop. Please email this file back to the Application Engineer dealing with your support request.
