Interfacing with a Terminal Design Software

AutoCAD Electrical

AutoCAD Electrical has always had the ability to interface with products like Weidmuller's RailDesigner, Wago's Smart Designer and Phoenix Contact's Clip software to name a few through Excel, CSV or ASCII delimited information. However in the latest release of AutoCAD Electrical (2015), the interface between the latter two products has been vastly improved with a direct integration.

These applications aid the user in selecting the correct accessories and provide an almost photographic representation of the terminal rail to be created. You can export terminal strips from AutoCAD Electrical and then import them to Wago or Phoenix Contact applications to design, manipulate, and validate the terminal strips.

During export, AutoCAD Electrical extracts the terminal data from the selected terminal strips and outputs to an XML file compatible with Wago or Phoenix Contact. You then import the XML file to the manufacturer software.

The terminal strip data includes catalog numbers, terminal numbers, installation code, location code, tag, spares, and accessories

In this month's tips and tricks, we will explain the procedure for interfacing with Wago's Smart Designer.

In AutoCAD Electrical Terminal Editor, Wago parts have been assigned and some accessories have been added.

V✓
Wago

Select the Import/Export Data ribbon tab > Export panel > Wago

Page **2** of **2**

Highlight the terminal strip, or Select All , you wish to export into Wago's Smart Designer

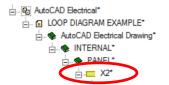

Choose the location of the export and then select ox

Start your Wago Smart Designer software

Select the Import/Export dropdown > Import XML data from CAE

Browse to the XML file that AutoCAD Electrical created and select Open

The AutoCAD Electrical data will be shown on the side panel

Highlighting the terminal strip in the side panel will build the terminal strip from the data
